# OIL DROPLET GENERATORS MODELS 9307

TSI's Oil Droplet Generators Model 9307 and 9307-6 produce large quantities of oil droplets for seeding flows when making Particle Image Velocimetry (PIV) or Laser Doppler Velocimetry (LDV) measurements. They are ideal for seeding high-speed flows during PIV measurements when large numbers of seed particles are required. Both atomizers work best with olive oil.

TSI's Oil Droplet Generators are a general-purpose atomizers that utilizes a Laskin nozzle to generate droplets for flow seeding. Pressurized air atomizes oil in the generator reservoir to produce the droplets. An internal impactor plate blocks large droplets from getting into the droplet stream exiting the device, allowing it to generate particles with a reasonably narrow size distribution.

Generally, a larger particle output volume can be obtained without seriously affecting the droplet size range by increasing the inlet pressure. A lockable regulator with pressure gauge provides an easy way to control the inlet air pressure. Both models are equipped with an external gauge which indicates the oil level in the atomizer chamber.
